## E911 Response System

The Teo E911 Response System provides enhanced facility safety by improving 911 emergency response times and procedures.

When a 911 call is detected, the system instantaneously notifies designated responders with detailed location, preferred access route, medical, and hazardous material proximity of the caller via screen pops, mobile text and email alerts. Offsite notification is also sent to the Public Safety Answering Point (PSAP), which enables the location of the call to be determined. Responders can acknowledge notifications, listen to calls in progress, and respond with the appropriate emergency response procedures provided by the alert. This improves emergency response effectiveness in high-stress situations.
